PDF TRANSLATION TEST / ENGLISH

A Small Desktop Project

A short text for testing English-to-Ukrainian translation.

Project overview

Our team is building a small desktop application. The application reads a PDF document, translates its text into Ukrainian, and saves a new PDF file. The original document should remain unchanged.

A typical workflow

First, the user selects a document and chooses its original language. Next, the translation runs in the background while a progress bar shows the current status. When the work is finished, the user can open the translated file.

Expected result

The translated document should contain readable Ukrainian text. A page without text should be marked with a clear explanation. If the internet connection is unavailable, the application should display a helpful message.

This sample contains selectable text and does not require OCR.
